

Electro FA™

TECHNICAL
INFORMATION

Digestive disorders during the first few days of life are one of the main cause of losses. These disorders can cause heavy losses of fluids and electrolytes, which are life-threatening to young animals. Common stressors which can upset the digestive system include:

- Environmental changes
- Transport
- Exposure to new animals
- Management procedures – such as vaccination
- Crowding
- Temperature fluctuations
- Reduction of feed intake

Agritech's solution was to develop **Electro First Aid** a liquid dietetic complementary feed for stabilisation of the electrolyte balance and to support the digestion for piglets, lambs and kids during periods of, or recovery from digestive disturbance such as diarrhea. **Electro FA™** contains the necessary ingredients to make all the difference in an easy to administer oral application dosing equipment.

Commercial field trial result

Dosage: 1 x 2 ml **Electro FA™**

Animal age: 2–4 days (DanBred) 47 piglets

Result: Stabilisation of physiological digestion in over 90% of animals.

So why use **Electro FA™**?

- ✓ It contains the major electrolytes sodium and potassium.
- ✓ Has an easy oral application via a handy bottle with metering device.
- ✓ Has a combination of flavourings and tannins, which have a fast binding effect on the intestines.
- ✓ It contains appetite-boosting plant compounds.
- ✓ A single dose of only 2 ml sustainably promotes healthy digestion and reduces diarrhoea
- ✓ Is suitable for piglets, lambs and kids.
