QuickStart™ – A quick & easy energy source for piglets

Over 60% of all losses in pig rearing occur during the first few days of a piglets' life. As piglets are born without any fat reserves, they have no stored energy during this critical phase of their lives. Piglets' energy supply is directly related to the intake of colostrum from the sow. The natural resilience and survival rates of piglets can only be improved if they receive an adequate supply of sow colostrum and energy during the first few hours after farrowing.

With today's highly prolific sows and up to 13 live born piglets there is major competition between siblings for the sow's teats for the available colostrum.

AgriTech's solution was to develop **QuickStart™** a liquid feed complementary feed for piglets that is given as an additional energy supply. This unique starter complex with an easy application contains readily available energy, gut flora stabilisers (a source of probiotics which can inhibit the growth of pathogenic bacteria, improve the immune system and correct the balance of the gut microflora) vitamins and egg powder to ensure that all piglets get a strong and **QuickStart** to life.

So why use **QuickStart™**?

- ✓ A quick oral dose of 2 ml provides a rapid supply of energy.
- ✓ Up to 4 ml can be given on first day of life, with a further 2 ml on day two if necessary.
- ✓ It contains the major fat soluble vitamins A and E along with Niacinamide.
- ✓ Has a combination of gut flora stabilisers (probiotics) to improve the immune system.
- ✓ Egg powder provides a source of immunoglobulins.
- ✓ Contains hydrolysed soya oil for a source of vital amino acids
- ✓ An easy oral application via a handy bottle with metering device.
- ✓ For reduced piglet losses.
- ✓ Increased weaning weight
- ✓ For a strong start.
